

4.5. Let  $B_t \in \mathbf{R}$ ,  $B_0 = 0$ . Define

$$\beta_k(t) = E[B_t^k]; \quad k = 0, 1, 2, \dots; \quad t \geq 0.$$

Use Itô's formula to prove that

$$\beta_k(t) = \frac{1}{2}k(k-1) \int_0^t \beta_{k-2}(s) ds; \quad k \geq 2.$$

Deduce that

$$E[B_t^4] = 3t^2 \quad (\text{see (2.2.14)})$$

and find

$$E[B_t^6].$$

Notice that:

$$k=0: \beta_0(t) = E[B_t^0] = 1$$

$$k=1: \beta_1(t) = E[B_t]$$

Let  $g_k(t, x) = x^k$ . Then, if  
 $\alpha_k(t) = g_k(t, B_t), \quad \beta_k(t) = E[\alpha_k(t)]$

By Itô's formula,  
 $d\alpha_k = k B_t^{k-1} dB_t + \frac{1}{2} k(k-1) B_t^{k-2} dt$

Hence,

$$\alpha_k = \int_0^+ k B_s^{k-1} dB_s + \frac{1}{2} \int_0^+ k(k-1) B_s^{k-2} ds$$

and

$$\beta_k = E \left[ \int_0^+ k B_s^{k-1} dB_s + \frac{1}{2} \int_0^+ k(k-1) B_s^{k-2} ds \right]$$

$$= k E \left[ \int_0^+ B_s^{k-1} dB_s \right] + \frac{1}{2} k(k-1) E \left[ \int_0^+ B_s^{k-2} ds \right]$$

$$= \frac{1}{2} k(k-1) \int_0^+ E[B_s^{k-2}] ds = \frac{1}{2} k(k-1) \int_0^+ \beta_{k-2} ds$$

With that

$$E[B_t^4] = 6 \int_0^t E[B_s^2] ds = 6 \int_0^t s ds = 6 \frac{t^2}{2} = 3t^2$$

and

$$\begin{aligned} E[B_t^6] &= 15 \int_0^t E[B_s^4] ds = 15 \int_0^t 3s^2 ds \\ &= 15 \cdot 3 \frac{t^3}{3} = 15t^3 \end{aligned}$$
