Solve the following stochastic differential equations:

(i) 
$$\begin{bmatrix} dX_1 \\ dX_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \end{bmatrix} dt + \begin{bmatrix} 1 & 0 \\ 0 & X_1 \end{bmatrix} \begin{bmatrix} dB_1 \\ dB_2 \end{bmatrix}$$

$$X_2(1) = X_2(0) + X_1(0)B_2 + \int_0^1 5dB_2 + \int_0^1 B_1dB_2$$

(ii) 
$$dX_t = X_t dt + dB_t$$
  
(Hint: Multiply both sides with "the integrating factor"  $e^{-t}$  and compare with  $d(e^{-t}X_t)$ )

On the other hand.

Thus,

| e | X = X + | f e | dBs 
$$= X + = e^{+}X_{0} + | f e^{(4-5)} dBs$$

$$X_{+} = e^{+}X_{0} + \int_{0}^{+} e^{(4-s)} dB_{s}$$

(iii) 
$$dX_t = -X_t dt + e^{-t} dB_t$$
.

solves the 506.
